

## Milestone 3

Milestone 3 was a bit more challenging for our group since our project was getting bigger and bigger and changing a section often required us to go through a process of changing other sections as well. Also, since the deadline for Assignment3 was really close to the deadline of Milestone 3, our group didn't get much chance to meet and work on the goals for this milestone.

Although we had a limited time, we met several times and tried our best to overcome some errors we were facing, alongside implementing some new features. For example, we changed the way that a claim food would be shown which is changed to a down-to-top sheet, and then we implemented a Done button to get back to the previous page.

Moreover, one of our biggest achievements was implementing the map. During this process, we used the address that the user inputted to indicate their geographical location, and show that in the map.

Further, we were able to work on our database and implement camera/photo library access and store them into our database for further use. At the moment, we are working on fetching back the images from the database in order to use them in other sections of our application.

Also, we implemented two new pages. The "FoodPosted" and "FoodClaimed" pages allow each user to see the foods they have posted or they claimed. Also, based on what we learned from Assignment3, we changed the Date Format, to a more aesthetically pleasant format.

Although we tried our best in such a short time, we still couldn't reach all of the goals we had in mind. However, since we are constantly researching and trying to push forward, we are positive that soon enough we will be able to add the rest of the features such as food ratings to our Database and our application.
